Abstract. The firm, considered to be a unitary system, disposes of a functioning mechanism defined by a few characteristics, which include:

- it is a unitary ensemble with an established juridical regime and a certain functional autonomy
- it has specific in and out parameters
- it is capable of self-adjusting its activity through its own management of informational links.

To do so, an important role is held by the analyses of the logistical system, which implies the component of logistics, and the physics and informational flow.
