Abstract: In the recent years, we have often spoken about recycling resources and saving energy. We have spoken about creating new jobs and the increasing GDS (Gross Domestic Product). All these things can become a reality if we continue to use cloud computing technology. However, we cannot ignore legislation when talking about cloud computing. Cloud computing technology should not continue development without adaptable and equitable rules for both sides: providers and clients.

Keywords: Cloud computing, platform models, provider limited, legal implications, standardization, data protection, contracts.
